

Python Phase 2

Steps on Data Cleaning

1. Load and inspect data
2. Check whether all required information is present.
3. Remove repeated or duplicate entries.
4. Correct spelling mistakes and inconsistent names.
5. Make dates and month names follow one common format.
6. Make financial values follow one common format.
7. Check that numbers are valid and do not contain incorrect symbols or text.
8. Identify and handle missing information.
9. Find and correct unusual or unrealistic values.
10. Ensure categories such as region, product, and department are properly grouped.
11. Compare related values to identify mismatches or inconsistencies.
12. Prepare and save one clean, organized dataset for analysis and report generation.
