

Python Project – Phase I

Automating Monthly Business Performance Reports

Problem Understanding

Companies prepare monthly business reports to understand how their business is performing. These reports include important information such as revenue, expenses, customer growth and overall business performance.

Currently, preparing these reports is mostly done manually. Data is collected from different sources, cleaned, checked, calculated and then put together to prepare the monthly report.

This process takes a lot of time and involves repeated work every month. Manual work can also lead to mistakes in calculations, differences in data and delays in preparing the reports.

Because management uses these reports to understand the business and make decisions, they need reports that are **accurate, consistent and available on time**.

Therefore, the company needs to automate the monthly reporting process to reduce manual work, avoid mistakes and make report preparation faster.

Proposed Solution

We will use **Python** to automate the monthly business reporting process. The data will be cleaned, processed and analyzed using Python, and the required monthly report will be generated.

The system will answer the following questions:

- How does the company's revenue change each month?
- How do the company's expenses change each month?
- How does the company's profit change each month?
- How does the number of customers change over time?
- Which products or business areas bring in the most revenue?
- What are the main changes and trends in business performance over time?
- Which areas of the business are performing poorly or showing a decline?

The analysis will help the company understand its monthly performance, identify changes and problem areas, and make better business decisions.

Objective

The main objective is to automate the monthly business reporting process and provide accurate and timely business information.

The analysis aims to:

- Reduce the manual work involved in preparing monthly reports.
- Compare monthly business performance.
- Understand revenue, expenses and profit trends.
- Track changes in the number of customers.
- Identify important changes and trends in the business.
- Identify areas where business performance needs improvement.
- Reduce mistakes in calculations and data handling.
- Help management make better business decisions.
